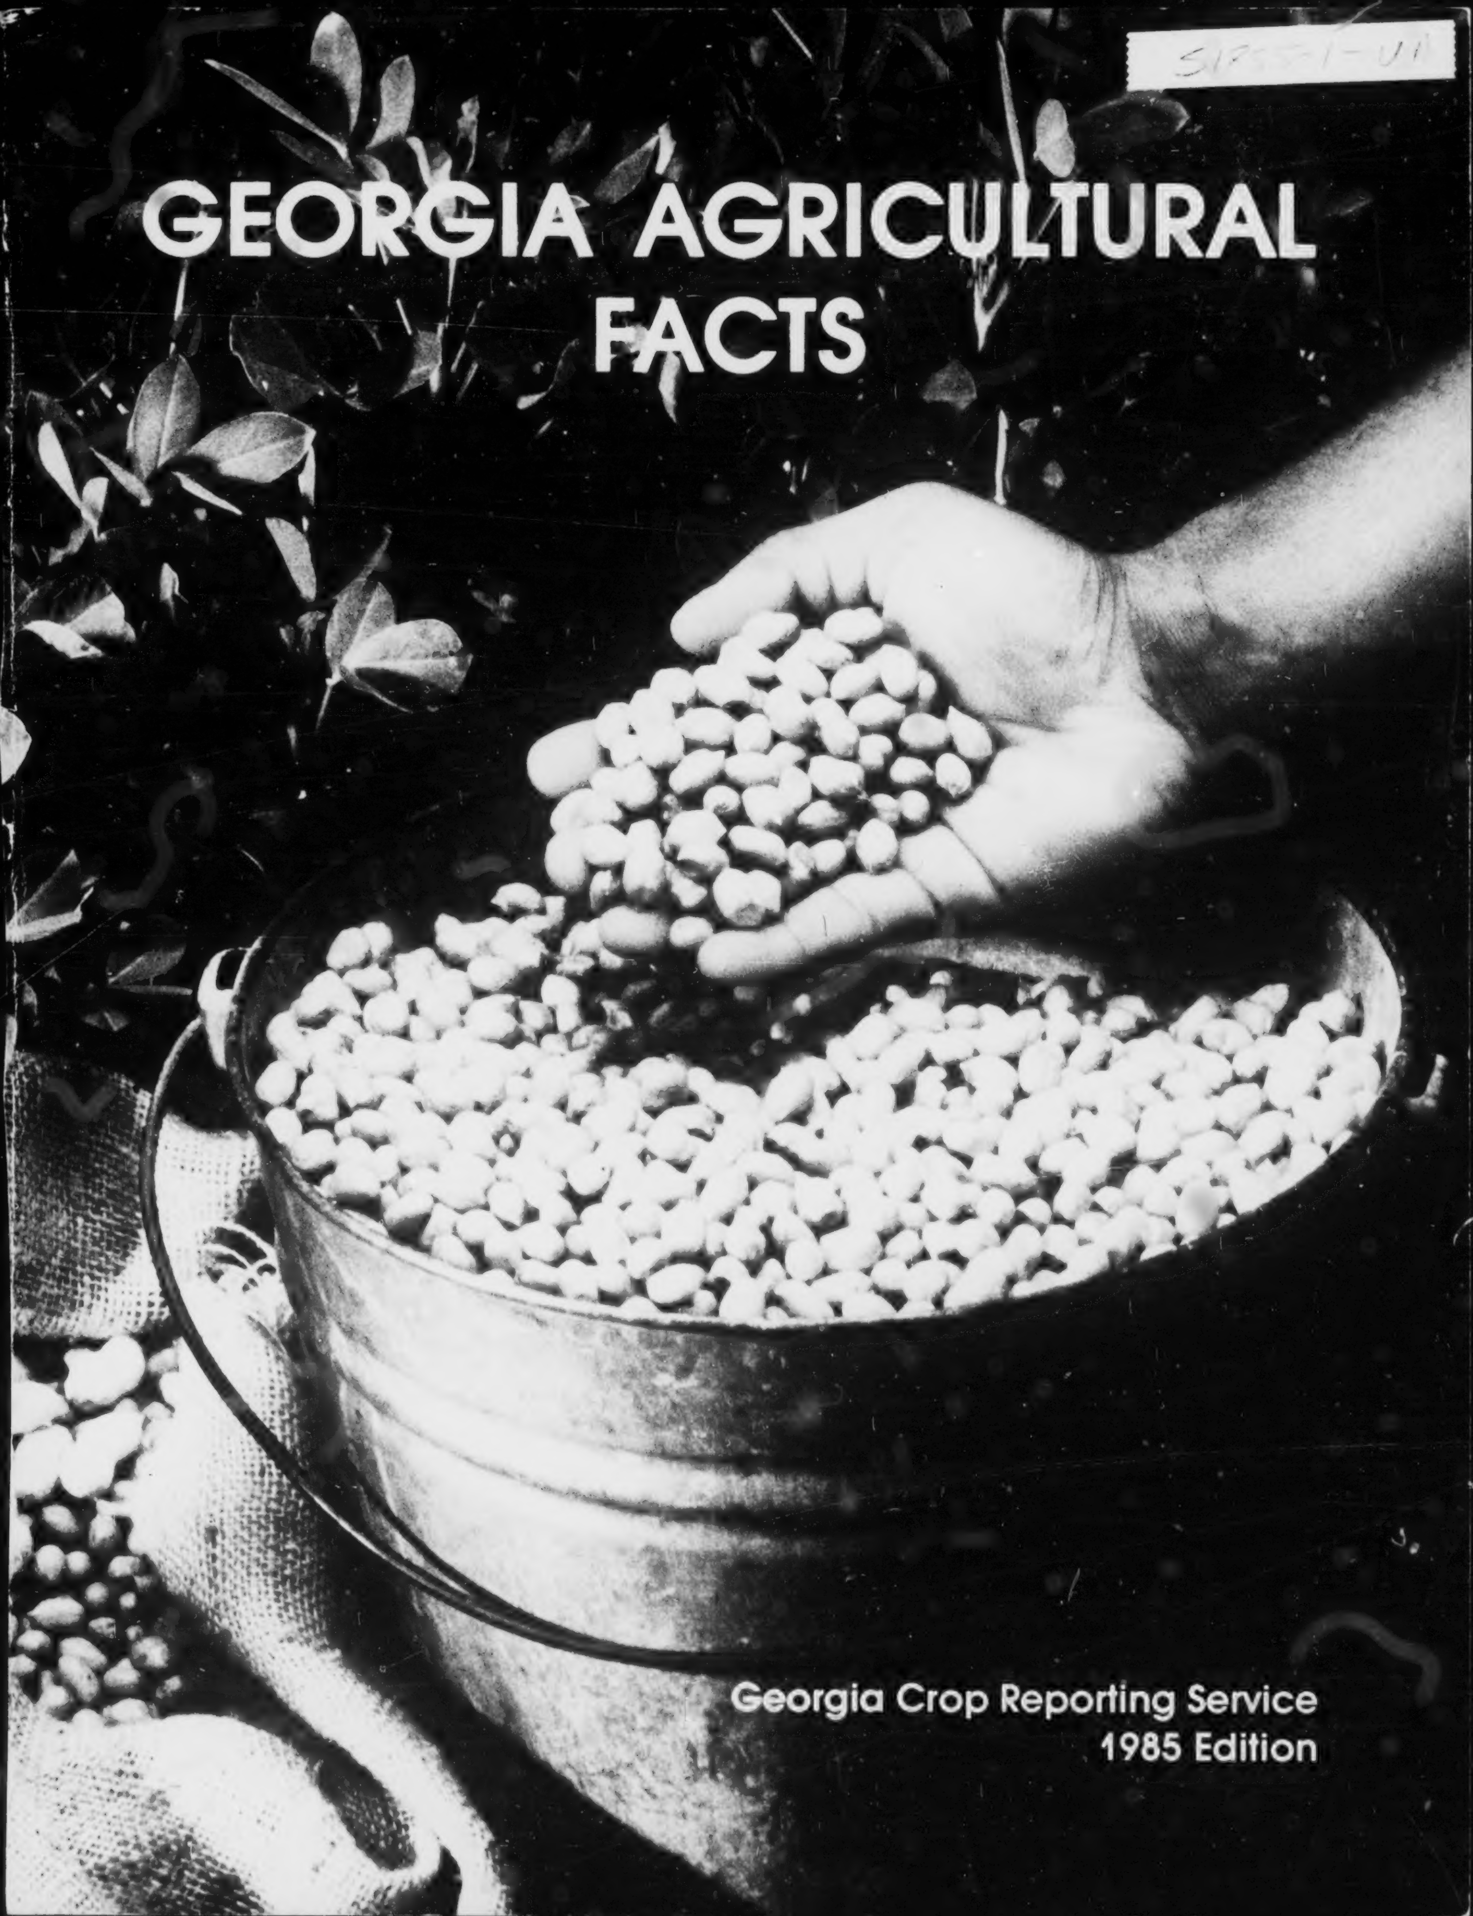
# GEORGIA AGRICULTURAL FACTS



Georgia Crop Reporting Service
1985 Edition

SPECIAL ACKNOWLEDGEMENT

Our special thanks and recognition to the Georgia Agricultural Commodity Commission for Peanuts for providing funds and photography for the color cover.

# MESSAGE FROM THE COMMISSIONER

Dear Fellow Georgians:

With each passing year, Georgia Agricultural Facts becomes an even greater resource for farmers, economists, decisionmakers and others interested in agricultural conditions and agribusiness trends. As farm conditions continue to change, and as America becomes more and more of an "information society", the facts contained in this reference serve an increasingly important role in documenting our State's agricultural heritage and our ongoing progress.

This year's edition of Georgia Agricultural Facts, by highlighting 25 years of statewide statistics for our major commodities, takes us to a new level of sophistication in tracking the trends that affect the lives of Georgia's 50,000 farmers and 5 1/2 million consumers.

Last year the Nation became more aware of farm issues through the many crises facing our farmers. Much debate has raged about the best way to handle these problems, but through it all, as these enclosed figures attest, Georgia farmers remained productive and our agricultural economy, while not at its strongest, has remained viable.

This publication, produced under a cooperative agreement with the Statistical Reporting Service, U.S. Department of Agriculture, and published by the Georgia Department of Agriculture, is dedicated to the men and women who make up Georgia's agricultural community. We trust it will serve you well.

Sincerely,

Tommy Irvin

# FOREWORD

This 1985 edition of the Georgia Agricultural Facts is a reference edition. Most state estimates from 1956 through 1984 and county data from 1975 through 1984 are included. An additional feature contains selected data from the 1982 Census of Agriculture. These Census data at the county level are frequently requested and are not available from our regular estimating program. It's with pleasure that we present this special edition and express our appreciation to the Georgia Department of Agriculture for providing funds to assist in the preparation and printing.

Few states can match the diversity of Georgia's agriculture. Receipts are almost evenly split between livestock and poultry enterprises and crop enterprises. Activities range from large corporate operations to part-time mini-farms, but the core of Georgia's agriculture is still the family farm. County estimates on crop production and livestock inventories in this publication show the great variability that exists in our agricultural industry in different areas of the state. Diversity and variability are major strengths of Georgia's agriculture that keep the lights burning during periods of financial difficulties and adversities.

During periods of adversity, farmers and others in agriculture seek answers that will return the farm unit to profitability. Information that is sound and reliable is a basic ingredient to finding answers. Between the covers of this publication are facts that not only tell a lot of this story of Georgia's agriculture during 1984, but for the past 20 years. These data should not be overlooked in planning for the future.

A major role of this Agency is also to collect and release current estimates and forecasts of what is happening and is expected to occur in the near future. A release schedule of these reports is shown on the last page of this publication. Estimates prepared are based on actual surveys that are designed to provide state estimates within a five percent error margin. Our role of providing basic data is not taken lightly and every effort within available resources is utilized to reflect the current situation accurately and without bias. This effort begins with survey design and continues through data collection, summarization, analysis, and finally the release of each crop and livestock statistic.

I'd like to thank each of the thousands of farmers and agri-businesses in our state that voluntarily report by mail, telephone, or personal interview on the numerous surveys conducted by the Georgia Crop Reporting Service. These individual reports are essential to obtain reliable facts and figures on Georgia's agriculture.

I would be remiss without expressing a sincere appreciation to personnel in the Extension Service, State Universities, the State Department of Agriculture, and other USDA agencies for their cooperation in helping keep us abreast of ever changing conditions, and in the dissemination of our information to data users.

Your suggestions or comments on this publication will be most welcome.

Sincerely,

Larry E. Snipes
Statistician In Charge

# CROPS

## CROP HIGHLIGHTS

Georgia's 1984 crops encountered widely varying weather patterns. Periods of fluctuation ranged from extreme wetness to drought, and from record cold to heat. The timing of the extremes was stressful to some crops, but proved beneficial to others. As a result, some crops had record or near record yields while others had weak performances. Early spring was very cool and wet with numerous fronts crossing the State. The resulting wet and cool soils delayed planting and caused slow germination and growth. June was very dry during the first three weeks, which allowed rapid planting and aided small grain harvest. The pattern reversed itself again in July and early August with a period of wet weather which improved growing conditions and yield prospects. Another change brought very dry conditions again in late August and it stayed dry through December. For crops, like peanuts and corn, that had reached or passed maturity, the dry fall was near ideal for harvest and reduced potential harvesting loss. For crops still developing, like soybeans, the extended dry spell had a decidedly negative effect.

## PEANUTS SET THREE RECORDS

Georgia's 1984 peanut crop was a bin-buster, with a record setting production of 2.16 billion pounds, up 38 percent from the 1983 output. The sharp increase resulted from the combination of a record yield of 3,375 pounds per acre and the largest harvested acres, at 640,000, since the 1951 crop. Overall value of the crop reached a record $521 million, also up 38 percent from the previous year. Peanuts alone accounted for one-third of the total value of all crops in 1984. The weather pattern of a wet July and a dry fall was very beneficial for all but the very late planted peanuts. Georgia remained unchallenged as the Nation's leading peanut producing state.

## COTTON YIELD RECORD HIGH

The average yield for Georgia's cotton growers was a phenomenal and record setting 784 pounds per acre. It surpassed the previous year's yield by a whopping 317 pounds per acre. There have been many years when the average yield for the State did not even reach 317 pounds. That excellent 1984 yield was the average for the 172,000 acres harvested, which was itself 50 percent higher than the previous year. Together, the acreage increase and record yield lifted production to 281,000 bales, more than double the previous year's output and the largest crop since 1974. The total value of the 1984 crop jumped 103 percent to $89.2 million. The average price received for lint at .592 cents per pound was 8.0 cents per pound lower than 1983.

## TOBACCO YIELD AND PRICE SET RECORDS

Tobacco acreage declined to the lowest level since 1932, but yield and price both went to the other extreme setting records highs. Tobacco was harvested from only 38,000 acres but the yield of 2,250 pounds per acre exceeded the previous record set in 1974. Even with the record yield, production, at 85.5 million pounds, was the smallest crop since 1957. The average price paid for the 1984 crop was a record high $182.60 per hundredweight. Despite the record high price, value of production, at $156.1 million, was the lowest since 1980.

## CORN JUMPS 47 PERCENT

Corn yield in 1984 was not a record, but it was a good one. So good, in fact, that it was the second best ever recorded for Georgia. At 82 bushels per acre, it was only 3 bushels below the record yield of 1982. Not only was the yield exceptional, but the number of acres harvested, at 985,000, rose 34 percent above the previous year's PIK-reduced acreage. Together, the good yield and the expanded acreage lifted production to 80.8 million bushels, a 47 percent increase over 1983 and the State's largest corn crop since 1979. Value of production at $242.3 million was the highest since 1979. Price was a very good $3.00 per bushel but still $.64 less than the 1983 price.

## SOYBEANS SLIP

Soybean prospects seemed bright on September 1, but the skies turned dry and those prospects shriveled under a hot sun. When the rains returned in November, it was too late to help the soybean crop. Georgia farmers harvested 2 million acres of soybeans, the same as the year before, but yields were disappointing. The average yield of 20 bushels per acre would have been even lower had part of the acreage not been irrigated and attained fairly respectable yields. Total production, at 40 million bushels, was off 5 percent from the 1983 crop, and 37 percent smaller than the 1982 crop. Price at $5.95 per bushel was well below the $7.59 received for the 1983 crop. Value of production totaled $238.0 million, down 25 percent from 1983.

## WHEAT ACRES DOWN

Georgia's 890,000 harvested acres of wheat in 1984 were the fourth highest ever, although it also marked the second straight year of decline. Fall planting progress during 1983 kept a slow pace and never caught up to average. However, production was up almost 1 percent to 31.2 million bushels, due to better yields. Georgia's average yield of 35 bushels per acre was the third time producers reached the fourth best yield of record. Despite the slight increase in production, the total value of Georgia wheat dropped to $99.7 million. The average price per bushel of wheat, at $3.20, was 4 cents less than 1983.

## FIELD CROPS: ACREAGE YIELD, PRODUCTION, AND VALUE OF PRODUCTION, GEORGIA, 1956-1984

| Year | Acres Planted | Acres Har-vested | Yield per Acre | Produc-tion | Season Average Price per Unit 1/ | Value of Production 1/ |
|---|---|---|---|---|---|---|
| | - - 1,000 Acres - - | | Bushels | 1,000 Bushels | Dollars per Bu. | 1,000 Dollars |
| CORN FOR GRAIN | | | | | | |
| 1956 | 2,736 | 2,131 | 24.0 | 51,144 | 1.24 | 63,419 |

# FRUITS AND NUTS

## *HIGHLIGHTS*

Georgia's 1984 fruit crops bloomed earlier than in 1983. Since part of the 1983 crops suffered serious freeze damage, there was much apprehension over the safety of the 1984 fruit crops. Despite the increased risk of blooming so early, the crops escaped with little or no freeze damage. It was the first time in a three year period that Georgia's fruit crops escaped freeze damage. Moisture was plentiful during most of the fruit crops' growing season, sometimes excessively so. Some fruit growers did suffer losses to widely scattered hail storms but overall losses were no greater than usually occur. A very dry fall hurt the pecan crop. Weekly harvesting progress for fruits and pecans was very close to the 5-year average harvesting progress.

## PECAN CROP UP 20 PERCENT

Georgia remained unchallenged in 1984 as the Nation's leading pecan state with a production of 120 million pounds, 20 percent more than the 1983 crop. Weather conditions after mid-August were not favorable for pecans, so much of the increased production was attributed to other factors. One of those factors was the continuing improvement in management practices, especially the expansion of irrigation. Another factor was the increase in bearing surface, as more young trees came into production.

Production forecasts during the 1984 growing season were quite controversial. The initial forecast on September 1 called for a production of 130 million pounds. At that time, what was to be an extended dry period was only two weeks old and conditions were still very favorable. By October 1, the dry spell was six weeks old and conditions were deteriorating not only from dry weather but from prolonged infestations of aphids. The October 1 forecast of 125 million reflected that. By mid-October, the drought was two months old and the aphid problem was no better. Some growers and grower representatives were very critical of the Georgia forecast and obtained substantial media coverage. The grower organizations requested a special November 1 survey since one was not scheduled for that date. That request was honored and a special November 1 survey was conducted for Georgia only. The results of the survey lowered the forecast to 115 million pounds. The regularly scheduled December 1 survey supported the November 1 forecast of 115 million pounds. Surveys covering all parts of the industry including growers, buyers and shellers and processors at the end of the marketing season showed that the crop had been underestimated and the final estimate was raised to 120 million pounds.

Harvesting progressed in a fairly routine manner and weekly completion percentages were very close to average. The dry weather did affect the quality of the 1984 crop with many of the non-irrigated nuts being light in weight due to incomplete development of the nutmeats. The average price growers received at 55.3 cents per pound, was off 7.6 cents per pound from the 1983 price. Because of the increased production, the overall value of the 1984 crop rose almost 6 percent to $66.4 million.

## PEACH CROP UP 46 PERCENT

That part of the 1984 peach crop that was utilized (sold or used) totaled 134 million pounds, which was 46 percent larger than the freeze-reduced 1983 crop. It was also the largest utilization of a peach crop since the 1979 crop. The earlier bloom period and the absence of freeze losses set the stage for higher production not only in Georgia but the other southeastern states as well. With the abundant supplies available, prices tumbled from the record high 25.1 cents per pound for the short 1983 crop to only 14.8 cents per pound in 1984, a drop of 10.3 cents per pound, or 41 percent less. The sharply higher production was not enough to offset that much price decline and the overall value of the crop fell 14 percent to $19.9 million.

There was little difference between the historic harvesting progress and the weekly harvesting progress in 1984. There were periods, however, when rainfall interferred with both fungus disease control and harvest. About 16 million pounds, or 11 percent of the total crop of 150 million pounds, were left unharvested, mainly due to low prices.

## APPLE PRODUCTION RECORD HIGH

Utilized production of apples rebounded from the 1983 freeze-damaged crop and jumped 137 percent to 45 million pounds. Total production, at 50 million pounds, was 150 percent above the 1983 crop. The average price that growers received for the crop, including fresh market and processing apples, was 8.4 cents per pound. That was only .2 cents per pound less than was received for the 1983 crop. Overall value of the crop rose from $1.64 million in 1983 to $3.76 million in 1984, a jump of 129 percent.

## GRAPE OUTPUT RISES

Like other fruits, grape utilization increased in 1984, rising 13 percent to 2,600 tons. That was 300 tons greater than the previous year. The average price received for both fresh and processed grapes was a record high $581 per ton. The combination of greater production and higher prices lifted the total value of the crop to $1.51 million, or 23 percent more than 1983.

Grape production, especially for wines, is expected to increase in the years ahead. Additional plantings of grapes, particularly European wine cultivars, occurred in 1984.

# POULTRY

## POULTRY HIGHLIGHTS

The value of production from all chickens including broilers, eggs and turkeys amounted to a record high $1,212.1 million for the 1984 production year, up $216.4 million from 1983. Georgia was second only to California in cash receipts from eggs and second to Arkansas in receipts from broilers. Value of production from broilers in Georgia totaled $835.5 million, up 23 percent from the $676.7 million in 1983. Total egg production at 4,468 million was 4 percent below the 1983 total production of 4,665 million. Value of production at $321.4 million was 15 percent above the $279.1 million for the 1983 production year. This was because of a substantial increase in price per dozen for both hatching and table eggs. Turkeys from Georgia's 1984 crop were valued at $34.6 million, an increase of 43 percent from the 1983 production value. The number produced increased 14 percent to 2.6 million birds.

For the second year in a row, the production of commercial broilers in Georgia hit a record high. The number sold, pounds sold, price per pound, and value of production were all at record high levels for 1984. However, total egg production in 1984 was down for the fifth consecutive year and was the lowest since 1965. The average number of all layers on hand was the lowest since 1964. The total number of spent hens sold for slaughter was the lowest since 1965.

Hens that had completed a forced molt on December 1, 1984 as a percent of hens and pullets of laying age, at 19.5 percent, were considerably less than the record high of 32.5 percent recorded on December 1, 1983. The prices for broilers, all eggs and spent hens were all above 1983 prices. The value of production for all chickens, eggs, and broilers in 1984 was 21 percent above the 1983 level.

## BROILER PRODUCTION UP

Georgia produced about 15 percent of the Nation's broilers in 1984. Production totaled 636.8 million birds during the marketing year, ending November 30, 1984, up 2 percent from the 626.6 million produced the previous year. Georgia produced 2.6 billion pounds of broilers in 1984, up 4 percent from the 2.5 billion pounds produced a year earlier. Not only has Georgia been increasing in number of broilers produced but the average live weight per bird has been increasing. In 1970, the average live weight per broiler slaughtered in Georgia was 3.55 pounds. In 1984, average live weight was 4.12 pounds per bird.

The number of spent fowl sold from Georgia's laying flocks in 1984 totaled 18.4 million, up 2 percent from the 18 million sold the previous year. A total of 655.1 million spent fowl and broilers were sold for slaughter in 1984, up 2 percent from 1983.

Prices in 1984 averaged a record 32.0 cents per pound for broilers, 5.0 cents per pound more than in 1983. The average price for spent fowl was 20.8 cents per pound, 4.8 cents more than the 16.0 cents per pound in 1983. This is 3.4 cents per pound more than the previous record high of 17.4 cents per pound in 1973.

## EGG PRODUCTION DOWN

Georgia's egg production during the year ending November 30, 1984, totaled 4.5 billion eggs. This was 4 percent less than the 4.7 billion produced in 1983. During 1984, the average number of layers was 18.6 million or 600 thousand less than the 19.2 million during 1983. The average number of layers in hatching egg flocks during 1984 was 5.1 million, about the same as during 1983. The average number of layers in table egg flocks was 13.5 million, down 4 percent from 1983. Georgia's layers produced an average of 240 eggs per hen during 1984, 3 eggs less than in 1983. Hatching egg producers sold 1.2 billion eggs during 1984 of which 74 million were sold as table eggs and 1.1 billion for hatching eggs. Producers of table eggs sold 3.3 billion eggs during 1984 bringing the total eggs sold to 4.5 billion.

The sale of table eggs accounted for 64 percent of the total cash receipts from eggs in 1984 while hatching eggs made up the other 36 percent. In 1983, table eggs were 65 percent of cash receipts and hatching eggs were 35 percent. The average price for all eggs during 1984 was 86.2 cents per dozen, 14.5 cents per dozen more than the 1983 average price. The record high 1984 average price for all eggs was because very favorable prices received for table eggs the first six months of the marketing year, and the strong prices received for hatching eggs the entire 12 months. Table egg prices averaged 72.3 cents per dozen in 1984. This was 11.7 cents more than 1983 prices and the highest of record. Hatching eggs brought an average price of 130.0 cents per dozen, 21.3 cents more than the 1983 average price. This was 1.8 cents less than the record high set back in 1981. During 1984, Indiana exceeded Georgia in average number of layers and total eggs produced. However, Georgia's cash value of production remained above Indiana. Georgia's total egg production was 74 percent table eggs and 26 percent hatching eggs, while Indiana's egg production was 98 percent table and 2 percent hatching. Hatching egg prices are much higher than table egg prices. The average price for all eggs in Georgia was 86.2 cents per dozen while in Indiana the price was 70.0 cents per dozen for all eggs.

## TURKEY CROP UP

During 1984, Georgia's turkey producers raised 2.6 million birds, 14 percent more than 1983, but 6 percent less than the record crop of 2.7 million in 1981. Only heavy breed turkeys are raised in Georgia. Turkey production in 1984 totaled 72.0 million pounds live weight, 20 percent more than in 1983 and 10 percent more pounds than produced in 1981.

The value of production of turkeys was a record $34.6 million, 43 percent more than 1983 and 36 percent more than the previous record set in 1981. The increase in total value was because of the record average high price and the record number of pounds produced. The live weight price in 1984 averaged 48 cents per pound, up 6 cents from the previous high of 42 cents in 1980. Most of the turkeys grown in Georgia during 1984 were toms and were grown to heavier weights than in previous years.

Georgia farmers raised 2,582,000 turkeys in 1984, 14 percent more than in 1983.

# LIVESTOCK AND DAIRY

## LIVESTOCK HIGHLIGHTS

Georgia's inventory of hogs at the end of 1984 was down from the previous year, while cattle numbers advanced slightly from January 1, 1984. This marked the fifth consecutive year hog inventory has declined. Cattle numbers rose for the first time since 1982. The lower hog numbers, however, failed to bring an improvement in prices. Hogs averaged $45.80 per cwt. for the 1984 marketing year, $.10 per cwt. less than 1983. Beef cattle prices also fell during 1984, averaging $44.10 per cwt., compared with $46.00 per cwt. in 1983.

Georgia ranked 25th nationally in the number of cattle and calves and 13th in hogs and pigs at the end of 1984. The number of hog places in Georgia, at 14,000 in 1984, was 600 below the previous year. Cattle operations numbered 37,000, 2,000 less than in 1983. The number of places with milk cows totaled 2,500 in 1984, 200 less than 1982. Cash receipts for dairymen and livestock producers totaled $595.3 million for 1984, 13 percent less than the previous year.

## CATTLE

All cattle and calves on Georgia farms on January 1, 1985 totaled 1,750,000 head, 1 percent above the previous year's total of 1,725,000. Cash receipts from the sale of cattle and calves in 1984 plunged to $193.1 million, 24 percent less than 1983 and the lowest since 1980.

The January 1, 1985 inventory value of all cattle and calves was $542.5 million, down slightly from the January 1, 1984 value of $543.4 million. The average value per head was $310, $5 per head less than 1984.

The 1984 calf crop totaled 780,000 head, the same as the 1983 calf crop. Morgan County took over the lead in the number of cattle and calves with 35,000 head, followed by Colquitt with 33,000, and Mitchell with 32,000.

## HOGS

The inventory of all hogs and pigs on Georgia farms on December 1, 1984, was estimated at a record low 1,200,000 head. This was the lowest inventory for a December 1 since estimates began in 1961 and broke the previous low set in 1965. The 1,200,000 head on farms December 1, 1984, equals the low point in hog number set way back in January 1870. Breeding stock, at 163,000 head, also broke the previous record low for December 1, set in 1965. The total value of the hog inventory on December 1, 1984, was $79.2 million compared with $73.6 million a year earlier. The average value per head rose from $54.50 in 1983 to $66.00 per head in 1984. Cash receipts from the sale of hogs in 1984 totaled $217.5 million, down 5 percent from 1983.

Producers had 283,000 sows to farrow from December 1, 1983, through November 30, 1984. This compares with 302,000 sows farrowing the same period a year earlier. The average number of pigs saved per litter was 7.10 which produced a total pig crop of 2,010,000. Colquitt County, with an estimated 71,000 head, continued as the leading county in total hogs and pigs.

## MILK PRODUCTION

Georgia's dairies produced 1,278 million pounds of milk during 1984, 8 percent less than 1983. Many producers participated in the "Dairy Diversion Program" in 1984, which reduced the number of milk cows. The annual average number of milk cows was 120,000 compared to 129,000 in 1983. Production per cow in 1984 dropped to 10,650 pounds compared to 10,814 pounds in 1983. Cash receipts from marketings totaled $184.7 million, 8 percent less than 1983. Putnam County was the leading county in the number of milk cows, with 9,200 in 1984, followed closely by Morgan County with 9,000.

## RED MEAT PRODUCTION

Slaughter plants in Georgia produced 418.9 million pounds of red meat (beef, veal, pork, and mutton) during 1984, a decrease of 10 percent from 1983.

Production of beef was up 10 percent from last year but pork was down 14 percent.

## CATTLE AND CALVES, NUMBER ON FARMS AND VALUE, JANUARY 1, GEORGIA, 1956-1985

# FARM INCOME, PRICES AND EXPENSES

## 1984 HIGHLIGHTS

Georgia farmers' gross farm income for 1984 soared to a record high $4.09 billion, 10 percent above 1983 and the first time ever over the $4 billion mark. Farm production expenses increased 1 percent to $3.01 billion. Allowing for a slight downward adjustment in farm inventories, total net farm income was up 78 percent from 1983 to a record high $1.1 billion. Factors responsible for the increase in net farm income were total cash receipts from farm marketings and the moderation of inventory reductions. The increase in cash receipts totaled $391.2 million. In addition, net changes in farm inventories amounted to a -$15.1 million in 1984 compared to a -$140.0 million in 1983.

## 1984 CASH RECEIPTS

Total cash receipts from farm marketings and government payments in 1984 at $3.67 billion were 12 percent above 1983. Cash receipts for crops registered a 17 percent increase over 1983 while cash receipts for livestock, poultry and products were up 8 percent from 1983. Cash receipts from crops accounted for 46.1 percent of the total in 1984 compared to 43.9 percent in 1983. Livestock, poultry and products accounted for 49.1 percent of the total compared to 50.9 percent in 1983. Government payments made up 2.1 percent of cash receipts in 1984 while forest products accounted for 2.7 percent.

Commercial broilers grossed a record $835 million or 22.2 percent of the total to again rank as the leading gross sales farm enterprise in Georgia. Eggs again ranked in fourth place among all commodities in cash receipts with 8.5 percent of the total and a strong rebound from 1983's reduced level. Cash receipts for hogs, cattle and calves and dairy products were off 5 percent, 24 percent and 8 percent respectively. Cash receipts from turkeys went over $30 million for the first time.

Peanuts were again the leading cash crop commodity, ranking second behind broilers. Cash receipts from peanuts were up 40 percent from last year and totaled $520 million or 13.8 percent of the total. Cash receipts from soybeans were up 27 percent from last year ranking soybeans as the third most important cash receipts commodity. Cotton, corn, and pecans were above 1983 while tobacco, wheat, and peaches were lower than 1983.

## PRICES RECEIVED BY GEORGIA FARMERS

Marketing year average prices in 1984 for poultry and products, sows, and milk increased. However, prices for all other livestock were below 1983. Broiler prices at 32.0 cents per pound were 5.0 cents higher than the previous year. The all eggs price averaged 86.2 cents per dozen, 14.5 cents above a year earlier. Season average milk price advanced 10 cents per cwt. from 1983 to 1984, while milk cow prices dropped $160 per head. Sow prices in 1984 rose slightly from 1983 and averaged $38.90 per cwt., 30 cents per cwt. more than 1983. The average price for beef cattle at $44.10 per cwt. was down 4 percent from 1983. Calf prices fell 6 percent to $51.20 per cwt. The average all hog price at $45.80 was 10 cents per cwt. below 1983.

The 1984 season average prices for crops were mixed when compared with a year earlier. Grapes, oats, rye, tobacco, and tomatoes were higher but apples, corn, cotton, cottonseed, hay, peaches, pecans, sorghum, soybeans, sweetpotatoes and wheat were lower than 1983. Peanut prices were unchanged from 1983 at 21.4 cents per pound. Soybeans averaged $5.95 per bushel, down from the 1983 season average price of $7.59. For the 1984 marketing year, tobacco averaged $1.826 per pound, up from $1.803 for 1983. Corn averaged $3.00 per bushel compared to $3.64 in 1983, and wheat at $3.20 per bushel was down 4 cents from the 1983 average. The average price received for cotton was down 12 percent and cottonseed was down 51 percent from the previous year.

## PRICES PAID BY GEORGIA FARMERS

The average prices paid by Georgia farmers during 1984 for commodities and services showed variable trends compared to a year earlier. Price increases were recorded for feed, seeds, fertilizer, pesticides, farm supplies, and farm machinery. Prices for motor supplies and fuels were down. Cottonseed and hybrid corn seed showed the largest percentage increase among individual items, as both were 30 percent above the 1983 average. The herbicide treflan showed the largest decrease, falling 13 percent from 1983. Feed prices varied from a 17 percent increase for broiler grower to a 6 percent decrease for soybean meal. Prices paid for motor supplies and services ranged from 10 percent less for heavy duty motor oil to 8 percent higher for motor tune-up. Prices paid for farm machinery increased from 3 to 10 percent for all items except cultivators, disk harrows and moldboard plows which showed no change to down 4 percent.

## 1984 FARM PRODUCTION EXPENSES

Total farm production expenses for Georgia farmers during 1984 were the highest in 3 years but still well below the record high production expenses established in 1981. The 1984 total farm production expenses at $3.01 million were 1 percent above 1983.

Sharp increases were recorded in expenses for seed, fertilizer, and lime. Expenditures for seed, at $71.0 million, were 19 percent above 1983. Fertilizer and lime expenses at $256.3 million were up 16 percent. Other items recording more moderate increases were: miscellaneous expenses up 6 percent to $646.0 million, livestock up 5 percent to $136.3 million, hired labor up 3 percent to $173.0 million, taxes on property up 2 percent to $66.6 million and interest on farm mortgage debt was up less than 1 percent at $257.2 million.

Decreases in expenditures were recorded for feed, repairs and operation of capital items, depreciation and net rent. Feed costs at $674.6 million were 5 percent below 1983. Depreciation and other consumption of farm capital dropped 3 percent to $387.4 million. Net rent to nonoperator landlords was down 3 percent from 1983 and totaled $58.8 million. Repairs and operation of capital items at $280.7 million in 1984 were down 2 percent.

Feed continued as the largest expense item comprising 22.4 percent of the total production expenses. Miscellaneous expenses were a close second making up 21.5 percent of the total. Some of the items in the miscellaneous category include such things as federal crop insurance, electricity, medicines and interest on production loans.

## WHAT'S THE FARM SLICE?

In 1984, farmers received only 27 cents out of the average dollar that consumers spent on food. This dollar included food consumed away from home, non-farm produced foods, and imported foods. Labor took the greatest share, 32 cents, of the food dollar.

# GENERAL

## WEATHER AND CROP SUMMARY, 1984

Georgia's 1984 climatological season began with low temperatures and wet soils. Cold damage to small grains limited growth and reduced forage supplies for cattle. Temperatures during February were highly variable but averaged above normal as was rainfall. The accumulated chill hours for most peach varieties were reached in early February. March was wetter and cooler than normal which caused delays in planting early row crops. Planting and crop development lagged in April due to continued cool temperatures and wet soils. Field work activity and especially planting continued to be hampered during early May because of the rain and wet fields. Field activity increased at mid-month under sunny skies. By month's end, planting progress of most crops had about caught up to normal. Record low temperatures the last of May slowed crop development. Dry weather during June stressed crops, especially corn. However, the dry conditions were nearly ideal for small grain harvest. July was very wet and crop prospects jumped. The first week of August saw the recording of the highest soil moisture ratings since early spring. The very favorable weather quickly changed to unfavorable as the rains stopped. Soil moisture supplies fell during August through September and by the end of September had reached the lowest mark of 1984. The 1984 harvest season for row crops was one of few weather interruptions. Rainfall for the August-December period was far below normal. This allowed for a rapid harvest pace with far below normal harvest losses. Tobacco, cotton, and peanut yields set new record highs. The peanut crop outturn was also a record high. Corn yield was the second highest of record. Rainfall averaged 48.52 inches for 1984, 2.77 inches below normal. The west central part of the State was the farthest below normal at -10.46 inches for the year. Temperatures averaged 63.0 degrees, 0.5 degrees below normal.

## JANUARY

January was a cool month. The average temperature at most reporting stations was one to five degrees below normal. Athens was the only station with an average temperature above normal and that by only one degree. The high temperature reported for the month was 74 degrees at Jesup and the low was 6 degrees at Clayton and Blairsville. Rainfall totals for the month ranged from near three inches to over eight. The greater totals were in the central and southern counties. The number of days with precipitation varied from seven days at Albany to seventeen at Claxton. The average temperature for Georgia in January was 42.8 degrees, 2.7 degrees below normal. Precipitation for the State averaged 4.83 inches, .19 inches above normal. The cold conditions damaged oats and hampered the growth of other small grains in some areas. The cold and wet conditions generally limited field activity. Winter grazing was restricted because of the early January cold damage to small grains and wet fields. At the end of the month cattle were in only fair condition and hogs were in fair to good condition. Tobacco beds came through the early January cold with only minimal loss but condition of the beds was only fair at the end of the month.

## FEBRUARY

Temperatures during February were highly variable. Extremes varied from 81 degrees at Bainbridge and Jesup to 3 degrees at Clayton. Average temperature for the month was about one degree above normal. Rainfall was heaviest over north Georgia with totals between 4 and 6 inches which was 1 to 2 inches more than normal. The rest of the State had totals in the 3 to 4 inch range. East Georgia had about normal rainfall while central and south Georgia generally had less than normal rainfall. Rain fell on about 5 to 10 days during the month. Soil temperatures started their slow seasonal rise but fell late in the month as cold and wet weather returned. For the month of February, rainfall averaged 4.77 inches, .24 inches above normal. Temperatures, statewide, averaged 49.3 degrees for the month, 1.2 degrees above normal. By the end of the first week of February, minimum chill hours for most varieties of peaches had been reached. The development stages of peaches at the end of February were a month ahead of schedule and causing concern across peach producing areas because of the possibility of freeze damage. Top dressing of small grains and land preparation were the main field activities. Tobacco plants were in mostly fair to good condition at the end of the month and transplanting had not gotten underway.

## MARCH

Freezing temperatures were common statewide the first two days of March with lows ranging from the teens in the mountains to the low and mid-20's across the remainder of the State. Temperatures were much above normal at mid-March with several days of 80 degrees or above across central and south Georgia. High temperatures for March ranged from 75 degrees at Blairsville to 87 degrees at Claxton. Heavy rain fell across south Georgia on the 5th and 6th with rain totals of 3 to 6 inches; otherwise, the first half of March was relatively dry. Severe weather and heavy rains struck the State the last week of March with some areas of southeast Georgia receiving over 7 inches of rain. Rainfall totals for the month ranged from 4 to 6 inches in the north and central sections of the State to 10 to 15 inches in the extreme south. Soil moisture ratings for the month ranged from adequate to mostly surplus. Wet, soggy fields delayed land preparation and planting with planting progress of most early planted row crops behind normal progress by the end of the month. However, peaches blooming were ahead of 1983. The average temperature in March was 54.5 degrees, 0.6 degrees below normal. Rainfall over the State averaged 6.15 inches, .59 inches above normal.

## APRIL

April was a wet month in most locations. Rainfall totals between two and four inches were common with local totals over seven inches in the south and 8 inches in the northeast. There were around twelve days with rain in the north and five to ten days over the remainder of the State. Most of these totals were above the normal for the month. The driest area was in the west central counties where rainfall totals were below normal. The average air temperatures during April were below normal over the State. Total precipitation since January 1 continued to be below normal in many locations but some local areas had nine to fourteen inches above normal amounts. Extended periods with wet soils slowed field work and average days suitable for field work ranged from 1.6 to 3.3. The heavy rains early in April caused considerable leaching of chemicals and fertilizers and also some problems with erosion. Drier weather in the central and south at mid-month allowed farmers to make good work progress. Corn, tobacco, and watermelon plantings were either equal to or ahead of the previous year's plantings by the end of the month. Cool soil temperatures were below the optimum for good germination early in the month but some significant warming occurred during the last week of April. At the end of the month, apple blooming was well ahead of last year. Average rainfall for Georgia in April was 4.76 inches, .56 inches above normal. Temperatures for the month averaged cooler than normal at 61.0 degrees, 2.6 degrees below normal.

## MAY

Most rainfall totals for May were between four and seven inches with local totals of eight to nine inches mostly in the northeast. Several counties suffered damage from tornadic winds, hail, and heavy rainfall early in the month. All rainfall totals were above normal except for some areas in the extreme southeast. Rainfall occurred on seven to eleven days during the month. The average temperature for the month was one to three degrees below the normal at most reporting stations. There was generally sufficient time between rain periods during May to allow farmers to make good progress with land preparation and spring planting. During the month, soil moisture remained adequate in most areas. The month ended with record low temperatures over much of the State. Freezing temperatures occurred in the mountains but apples were only very slightly affected. This was the latest date for a spring freeze in Georgia since 1961. By month's end, virtually all the corn was planted and wheat headed; small grains were in fair to mostly good condition. Livestock were rated in mostly good condition. At the end of the month, crop development was well behind average. Tobacco harvest had not yet begun and wheat harvest progress trailed both 1983 and average. Temperatures averaged 69.2 degrees, 1.5 degrees below normal. Georgia's precipitation averaged 5.12 inches, .78 inches above normal.

## JUNE

During June, most reporting stations had rain on two to eight days with rainfall totals mostly between one and three inches. These totals were two to four inches below normal. In local areas some totals were five to six inches and above normal. Open pan evaporation averaged around one-quarter inch daily. In the northern half of the State, temperatures exceeded 90 degrees on 11 to 22 days. Over the central and south, 90 degrees was exceeded 20 to 25 days, and 15 to 20 days in the east. The temperature rose above the 100 degree mark on one or two days over the central and south. Average temperatures for the month were one or two degrees above normal in the northern half of the State, near normal in the central counties, and one or two degrees below normal in the south. During the 2nd and 3rd weeks of June, row crops were suffering due to the sharply lower soil moisture supplies and high temperatures. Rains came to many areas around the 20th of the month and reversed the trend of deteriorating crop conditions. The main activities during the month were haying, planting, harvesting, and spraying for weeds and insect control. Pasture conditions ranged from mostly good at the beginning of the month and declined to mostly fair by month's end. Soil moisture, by the end of the month, was on the short side but still the best since early June. Wheat harvest, after a slow start was aided by three weeks of dry, hot weather and harvest progress caught up with average harvest progress by the end of the month. Tobacco harvest progress continued behind normal. For the month of June, rainfall averaged 3.06 inches, 1.26 inches below normal. Temperatures averaged 77.2 degrees, .5 degrees above normal.

## JULY

July was a wet month with rain reported somewhere in the State everyday. Rainfall totals were mostly in the six to ten inch range with lighter amounts occurring mainly over east Georgia. Local totals exceeding eleven inches occurred with Toccoa reporting sixteen inches of rain during the month. Rainfall totals were near normal in the east, but three to six inches above normal over the remainder of the State. Temperatures in July averaged one to four degrees below normal. The highest temperature for the month was 99 degrees at Dublin and Hawkinsville on the 11th. The lowest temperature reported was 52 degrees at Blairsville on the 3rd, 9th and 19th of July. Soil temperatures averaged in the low and mid-80's and daily open pan evaporation averaged around one-quarter inch. Heavy rains at the end of July caused numerous delays in the harvesting of hay, tobacco, fruit, vegetables and early corn. Pest, disease, and insect control programs were also delayed. Pasture conditions improved during the month and at the end of the month were rated mostly good. Expectations were very high for good soybean and peanut crops at the end of July. By the end of the month, tobacco harvest progress was far behind the normal pace and corn harvest was off to a slow start. Peach harvest was nearing completion and equal to the average completion rate. Apple harvest was off to a good start equaling the normal pace. Rainfall averaged 8.57 inches, 3.23 inches above normal. Temperatures for the State averaged 77.4 degrees, 1.9 degrees below normal.

## AUGUST

Wet and cool weather prevailed during the beginning of August. Rainfall totals in the first part of August were generally in the one to three inch range except over east Georgia, where less than an inch had fallen on many farms. Temperatures averaged a degree or two below normal at most locations. Maximum temperatures reached into the 90's over most of the State with some readings in the upper 90's reported across central and southern counties. Several cool fronts brought temperatures as cool as the mid-50's to the Georgia mountains with lowest readings in the low 60's elsewhere. More than normal amounts of rain fell in a number of areas while other areas had less than half their normal rainfall. Rain fell on approximately 7 to 14 days during the month. Average days suitable for field work for the week ending August 3 was 0.9. Soggy fields kept field activity at a standstill early in the month. As the soils dried, field activity picked up with haying, harvesting, and crop pest control being active. Corn harvest was behind the 5-year average the entire month due to later spring planting and harvest delays caused by frequent earlier rain and soggy fields. White mold was a problem in some peanut fields. Pastures were rated good as were livestock at the end of the month. Soil moisture supplies fell sharply during the month and by the end of the month were at the lowest level since mid-July. Peanut harvest got off to a very slow start running behind normal and even behind the very slow pace of 1983. Temperature for the State averaged 78.1 degrees, 0.9 degrees below normal. Precipitation averaged 3.78 inches, 0.64 inches below normal.

## SEPTEMBER

September was a very dry month across Georgia except for the rain brought to the southeast by tropical storm Isidore during the last week of the month. Rain fell only during two or three days of the month except in the southeast which had rain on six to eleven days. Rainfall over the southeast was between one and six inches with most of it occurring during the last week of September. Rainfall totals over other areas of the State were mostly less than one-half inch with many stations receiving less than one-quarter inch. It was a cool month with almost all average temperatures one to four degrees below normal. The lowest temperature at mid-month was 41 degrees at Blairsville on the morning of the 16th and at Clayton on Monday morning the 17th. The four-inch soil temperatures at mid-September averaged five to ten degrees above normal. The generally dry weather of September was ideal for harvesting of corn, apples, and peanuts. Harvesting loss for corn and especially peanuts were held at a minimum and, by the end of the month, harvest progress for most crops except cotton was near normal after the slow starts. A little over one-half of the peanut crop was threshed by month's end. Tobacco harvest was virtually complete. Pastures and late row crops were in dire need of rain across much of the State. Soil moisture supplies had plunged to the lowest level of the year. Soybeans, which held such wonderful potential in early August, deteriorated rapidly during September and were at the lowest condition rating of the year at the end of the month. Planting of small grains was being slowed by dry soils. Livestock rating was fair to good, mostly good. Rainfall in September averaged a meager 1.14 inches, 3.01 inches below normal. Temperatures for the month were cooler than normal averaging 72.1 degrees, 2.2 degrees below normal.

## OCTOBER

The month was off to a cool start with lows around the freezing mark and some frost in the north. However, the remainder of the month had above normal temperatures with records reached or exceeded. Average temperatures during October were five to eight degrees above normal in the north and four to nine degrees above normal elsewhere. Rain totals were one to four inches across the north and one-half to two inches across the remaining part of the State except for a few local totals over four inches. Soil temperatures were above normal during most of October. Seeding of small grains was far behind the previous year and the five year average all month. Peanut harvest at month's end was nearing completion and progress was comparable to the average. Soybean harvest was ahead of both the previous year and the average. Cotton harvest ran behind normal all month but considerable "catching up" occurred the latter part of the month. Apple harvest was about complete at month's end as was the State's corn harvest. Pecan harvest was running slower than normal and was about 20 percent complete. Pasture condition declined to mostly poor. Cattle condition rating declined to mostly fair. Hogs were rated mostly good. Rainfall averaged 1.99 inches, 0.61 inches below normal. Temperatures averaged 69.7 degrees, 5.8 degrees above normal.

## NOVEMBER

Temperatures in November averaged one to three degrees cooler than normal. Freezing temperatures occurred on 10 to 15 days across much of the north and mid-central sections of the State but only one to three days across the southeast. The warmest temperature of 85 degrees occurred the first day of November at Blakely. The lowest temperature recorded was 14 degrees at Clayton on November 22nd. Rainfall totals averaged two to three inches over the north, west and south with local totals of four inches in the extreme north and extreme south. Central Georgia reported only one to two inches of rain with some areas receiving less than one inch of rain. Row crop harvesting and other field work made good progress across Georgia in November. Cotton and soybean harvest progress was ahead of average at month's end. The seeding of small grains and winter cover crops increased as soil moisture improvement occurred across much of the State but progress continued behind normal. The major exception in soil moisture improvement was over central Georgia where shortages delayed the planting of small grains. Georgia rainfall averaged 2.35 inches, .62 inches below normal. Temperatures for the State averaged 52.1 degrees, 2.2 degrees below normal.

## DECEMBER

December was an unseasonably warm month across Georgia with numerous record high temperatures at mid and late month. Temperatures frequently averaged 10 to 20 degrees above normal the last three weeks of the month. However, this was preceeded by a brief cold spell early in the month with minimum temperatures from the single digits in the mountains to the low and mid-20's in the extreme south. Temperatures for the month averaged seven to ten degrees warmer than normal. Rainfall totals for the month ranged from near three inches in the north to less than one-half inch across the southeast and extreme south. Mean four inch soil temperatures at late December were averaging almost fifteen degrees warmer than normal. The much above normal temperatures at mid and late December allowed very few peach chill hours to accumulate holding chill hours for the season well below normal in most areas. By the 26th of the month, cotton was virtually all harvested and tobacco bed preparation and care was active. Soybean harvest was in the final stages. Temperatures in December were well above normal averaging 53.0 degrees, 7.5 degrees above normal. Rainfall was just the opposite with an average of 1.98 inches, a 2.21 inch deficit.

| April 7-13 | 3.51 | 3.18 | 3.85 | 5.76 | 3.39 | 3.58 | 8/ | 3.38 |
| July 7-13 | 3.48 | 3.29 | 3.74 | 6.02 | 3.45 | 3.43 | 3.47 | 3.57 |

1/ Beginning in 1985, Farm Labor data published regionally. The Southeast region includes GA, AL, and SC. 2/ Quarterly estimates discontinued after April 1981. Estimates made annually in 1982-83; current program is for estimates in Apr., July, and October. 3/ Excludes agricultural service workers. 4/ Includes only family members who worked 15 hours or more during survey week without receiving cash wages. 5/ Jan. and Apr. 1981 surveys did not classify self-employed and unpaid family workers separately. 6/ Includes machine operators only in Apr. 1981 and earlier surveys. After Apr. 1981, classification includes machine operators, bookkeepers, buyers, etc. 7/ Includes wages based on salary or commission paid by day, week, etc. 8/ Insufficient data, included in all hired wage rates.

# 1982 CENSUS OF AGRICULTURE

The preceding pages of this publication consist of information gathered and prepared by the Georgia Crop Reporting Service. The following pages contain selected data from the 1982 Census of Agriculture with comparisons to the 1978 Census. The current definition of a farm, for statistical purposes, is any place from which $1,000 or more of agricultural products were sold or normally would have been sold during the year. This same definition was used for the 1978 Census.

Censuses prior to 1969 were conducted by direct enumeration and found to be less and less complete. Thus, beginning with 1969, the Census was conducted primarily by mail; however, complete coverage was still not obtained as the lists used to create the Census mailings were not adequate to provide complete coverage. The 1978 Census of Agriculture was supplemented by an area segment sample which provided estimates of the number and characteristics of any farms not represented in the mail survey. This estimate of incompleteness was an integral part of the 1978 state totals but was not allocated to county totals. To provide comparable data for 1982 and 1978, estimates from the 1978 area sample have been subtracted from the 1978 data.

The following table shows the 1982 results and adjusted 1978 data for farms on the mail list, as well as 1978 data which include estimates for farms not on the mail list. The percent of the 1978 total represented by the area sample portion is the incompleteness in the 1978 data and may or may not be comparable to the 1982 incompleteness.

EFFECT OF 1978 AREA SAMPLE ON CENSUS COMPARABILITY: 1982 AND 1978

| Item | Unit | Data Published in 1982 Census of Agriculture | | Data Published in 1978 Census of Agriculture | | Percent of 1978 Total Represented by area Sample Portion |
|---|---|---|---|---|---|---|
| | | 1982 | 1978 Adjusted 1/ | 1978 Total 2/ | Portion of Total from 1978 Area Sample 3/ | |

## ESTIMATES ISSUED BY GEORGIA CROP REPORTING SERVICE

Current estimates of many data items included in this publication are available from the Georgia Crop Reporting Service at various times throughout the year. The table below indicates the months data are available. Current data may be obtained by calling the Crop Reporting Service or interested persons may be added to one or more of our five mailing lists. The five separate mailing lists are: (1) Weekly Weather and Crops, (2) Weekly Broiler Report, (3) Georgia Agricultural Facts, (4) Georgia Poultry Facts and (5) Georgia Farm Report, a semi-monthly publication containing various crop, livestock, price, and other farm data. The annual charge for these publications is: Weekly Weather and Crops, $12; Weekly Broiler Report, $15; Georgia Agricultural Facts, $5; Georgia Poultry Facts, $5; and Georgia Farm Report, $10. Reports are available free of charge to farmers and agribusiness firms who provide the basic data on which reports are based. Within availability constraints, a copy of the Georgia Agricultural Facts and Poultry Facts is available to Georgia residents without charge. An order form may be obtained by calling (404-546-2236) or writing the Georgia Crop Reporting Service.
